

# Signatures of drought and flooding events in terrestrial water storage anomalies and fluxes

Roelof Rietbroek<sup>1</sup>, Sedigheh Karimi<sup>1</sup>, Amin Shakya<sup>1</sup>

1) University of Twente, Faculty of Geo-information and Earth Observation, WRS, Netherlands

Compute non-seasonal anomalies by removing monthly climatologies

# Conclusion

- Known flooding events visible in fluxes from both GRACE and ERA5/GLoFAS
  - Droughts harder to detect but more prominent in storage anomalies
  - Integration of P-ET-R seem to 'wander' from GRACE/GFO (due to P-ET correlated errors or GRACE signal attenuation?)

The logo of the European Geosciences Union (EGU) is displayed. It consists of a white circular emblem containing the letters "EGU" in a bold, sans-serif font. The background of the slide is a dark, textured image of a geological outcrop.

The logo of the University of Twente, featuring the text "UNIVERSITY OF TWENTE" in white, bold, sans-serif capital letters. The letters are partially cut off on the left side by a thick black vertical bar. The background is a dark, textured image of a landscape.
